

Dynamic Part Inspection Software for Faro Arms and Faro Laser Tracker

Softcheck Tools are ready to use part inspection programs for use with FaroArms and Faro Laser Tracker manufacturing measurement systems.

Unlike traditional coordinate measurement software, Softcheck Tools are immediately used as delivered to measure parts and assemblies without the need for additional programming or training. Valuable dimensional data can be monitored and reported "in-process", providing manufacturers substantial savings through improvements in production efficiency and scrap reduction.

Softcheck Tools™, run like games in a videogame player. Each Softcheck Tool is written separately for individual products or parts. In these game-like configurations, operators are prompted to measure specific points marked by coloured balls that appear on the screen. The system is so simple to operate that, once set up on an item to inspect, an operator with no training can use it.

Common applications

Guided manual measurement

Direct measurement of batch production

Measurements by production personnel

Comes with Starter Tool Library of common feature measurements

Brings you to exact point on your part

Softcheck Tool Manager v2.0
